

LIFT-CABIN – maximum flexibility & comfort

KEY FACTS:

- **Ergonomics and comfort:**
The lifting cabin enables comfortable height adjustment and ensures an ergonomic seating position.
- **Stepless height adjustment:**
The cabin can be raised steplessly to a lifting height of approx. 2300 mm. Lifting is achieved via a powerful hydraulic cylinder with a load-holding valve.
- **Improved visibility and cabin position:**
The conversion moves the cab forward by approximately 700 mm. This improves visibility of the working area and creates additional space.
- **Robust lifting mechanism with parallel kinematics:**
The lifting frame is connected to the excavator's undercarriage via a parallel kinematic system, ensuring stable, safe movement of the cab throughout the entire lifting range.
- **Simple control:**
The system is operated via the medium-pressure line. No additional controls are required.
- **Integrated emergency lowering:**
An emergency lowering function is integrated for maximum safety. This can be activated both from inside the cabin and from the ground.
- **All relevant lines** will be professionally adjusted and extended.
- **Can be easily combined** with our 'PROTECTOR E4' cab protection.
- **Corrosion protection and a high-quality finish:**
All components are sandblasted, primed and painted – ensuring long-lasting protection and a high-quality finish.
